

ABSTRACT OF THE DISCLOSURE

An electronic device includes a display section and an antenna. The antenna is provided on the back of a display panel within a housing of the display section.

5 The housing of the display section has an opening to surround an area for mounting the antenna. Even with the antenna disposed within the housing of the display section, antenna performance is improved. The electronic device has a reduced size and a higher

10 package density, as well as reliable communications with constant stability.
